

Regaining final missing
speech sounds

Regain final missing speech sounds → **tongue twisters**

Rehabilitation task : vocalization of last missing speech sounds.

Effect on *my* rehabilitation case : regaining these speech sounds.

Practice details

Practice time period : 4 months

Daily practice : 1h

Personal rehabilitation use

I experienced the efficiency of these idioms to regain, for instance, the “s” speech sound and the “ch/s” speech sounds chain.

Early rehabilitatory use of tongue twisters on my part would have been premature.

They are a good means to work on speech sounds or speech sounds combinations which still are to be regained fully. However, they are much too difficult to express to be used to re-learn speech sounds.

I do not include links, because all my links were for the French language.

The person who wants to rehabilitate will of course find tongue-twisters in her language.
